FIRST THINGS FIRST: THANK YOU!

Thank you for helping test Kapha Bio's new products. Inspired by the glycoprotein mucin, which is the body's natural protective coating, our technology is designed to support the skin's natural microbiome while helping soothe dryness and irritation. This innovative approach has the potential to provide relief for the many people affected by these conditions, and your participation in this beta testing is an important step in helping us advance our products towards the market. We are incredibly grateful for your time, support, and willingness to be part of this process.

COMPANY CONTACTS

If you have any questions, contact **Maddie Krieger** - Beta Testing Program Coordinator
mkrieger@kaphabio.com
541-510-3128 (*feel free to text with any urgent questions/concerns)*

If you need to withdraw from the study for any reason, please contact Maddie BEFORE or immediately after stopping product use. We want to capture your experience with an early-exit survey.

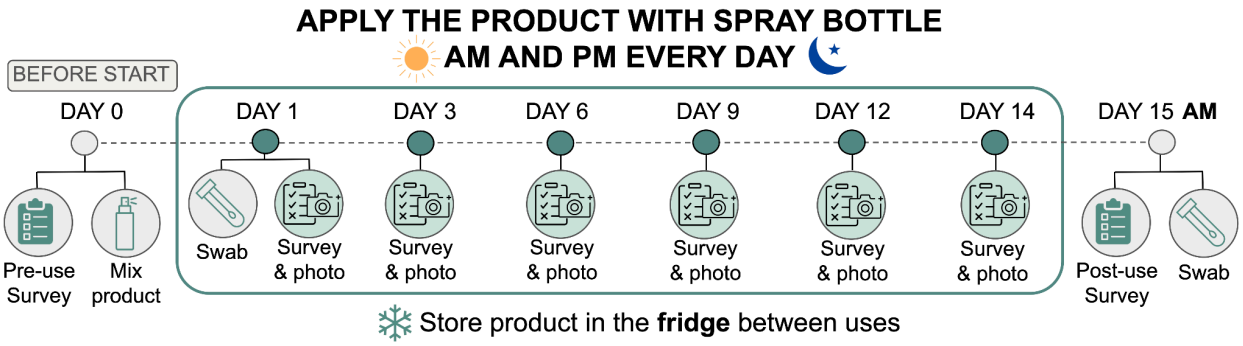

WHAT YOU'LL BE DOING

What's involved:

- Use the product 2x daily for 2 weeks
- Fill out surveys about your symptoms
- Take a microbiome swab at the start and end of the testing period
- Ship your swabs back to us

What you get:

- 🧴 Free product
- 🧫 Your own personalized microbiome report
- 🥰 Possible relief from your symptom

KIT CONTENTS

- Powdered product (labeled “mucin”) in a conical tube
- Water in a conical tube
- 1 spray bottle (empty)
- 3x skin swabs (you only need 2x for the study, but we included an extra)
- 12 red, small sticky circles
- Marker
- Small plastic funnel

Key things to Note BEFORE YOU BEGIN

- You will be applying the product twice a day for 14 days. A schedule and instructions are included in this document.
- You’ll be swabbing your skin before and after these 14 days (Day 1 and Day 15). We provide detailed instructions on how to do this below.
- You will be filling out perception surveys and submitting photos of the affected area during the duration of product use.
- Do not stop or start any other treatments - keep things consistent! Note any other treatments you are using in the surveys.
- If the affected area is in an area you shave, try and keep your shaving routine consistent (e.g. shave every day, every other day, every two days). Do not shave immediately before taking photos.

INSTRUCTIONS

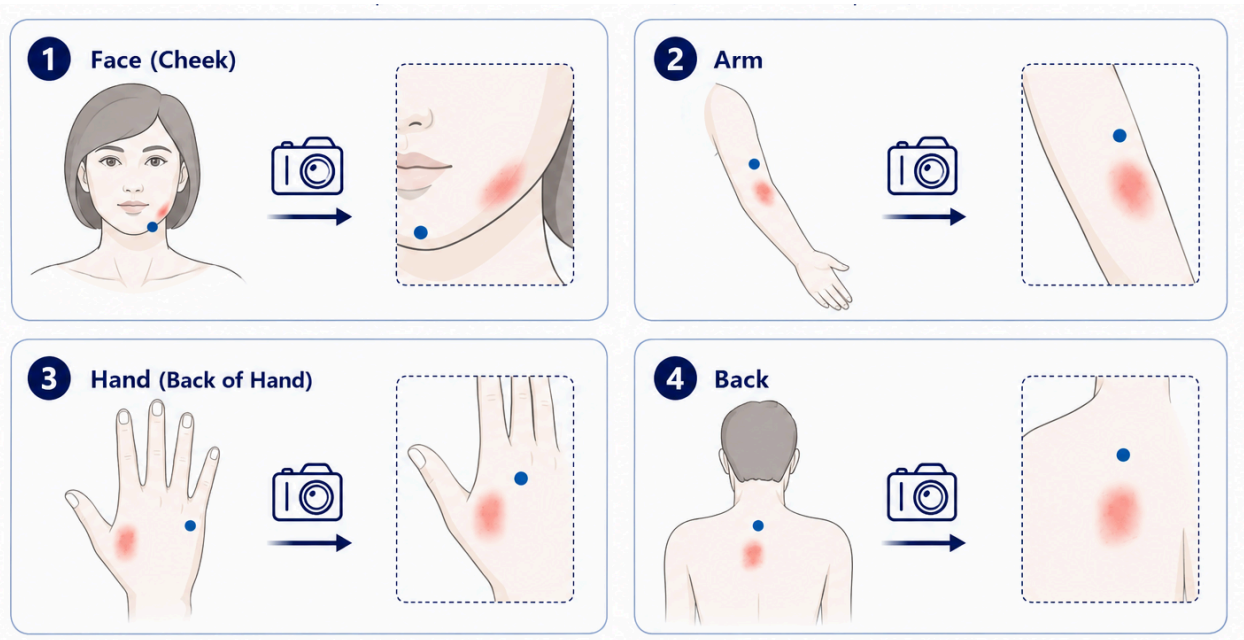

How to: Identify an affected site for use (Before start)

1. Skin problems can occur anywhere on the body! For this beta test, you will want to identify **ONE** affected area to apply the product to.
2. Ideally, the affected area should be between **1-2 inches** in diameter and be surrounded by generally healthy skin. If you do not have a patch of affected skin that fits this criteria, that is ok! Choose whatever spot most closely resembles this description. If you only have one affected area, use that for product application.
3. You will be taking photographs of and applying the product to **this area only**.
4. Only answer the questions in the pre-, post-, and during-study surveys about **this specific area** you are treating with the product.

How to: Capture pictures of the affected site

Use these instructions to capture photos for the Pre-use Survey on Day 0 (Before you start), to take photos for the Skin Perception Survey on Days 1, 3, 6, 9, 12, and 14 and for the Post-use Survey on Day 15.

1. When you photograph the affected area during the duration of the beta test, we will ask you to put a **small sticker dot** on the **same** patch of normal skin **adjacent** to the affected skin. Try as hard as possible to place the dot on the same area for each photo. The dot in the example image below is blue, but yours might be a different color (e.g. red).
2. If possible, write the **date** (month/day) on the sticky dot prior to taking the photo.
3. Do your best to ensure that **background**, **lighting**, **focus**, and photograph **angle** are consistent between photos so we can accurately compare photos.
    a. When taking your first photo on **Day 0**, evaluate what environment (background, lighting, focus) **best displays** the symptoms you are experiencing. Use that same environment and settings to capture subsequent photos throughout the study.
    b. We recommend capturing the photo in an environment with **consistent artificial lighting**, such as a bathroom.
4. If you need, have a friend or family member take the photo.
5. For orientation, it is helpful to include another body part in the photo if appropriate (e.g. earlobe, adjacent finger).

How to: Perform your skin swab (Day 1 and Day 15)

On both Day 1 and Day 15, perform the swab ***first thing in the morning*** *on unwashed skin, before applying the product or any other skincare products.*

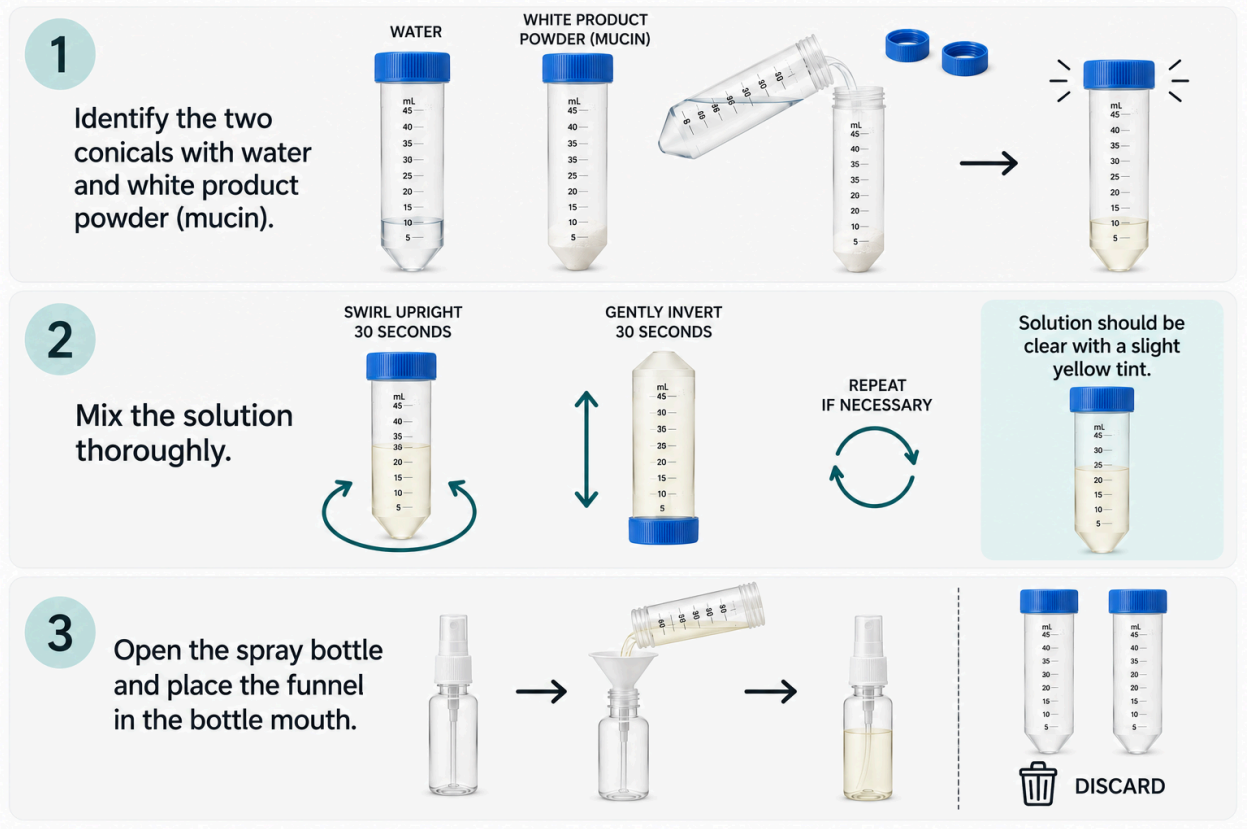

The swab kit includes (1) a swab and (2) a tube.

1. Open the sterile swab package without touching the swab's spongy tip and remove the swab from the packaging, holding only the end of the handle.
2. Hold the swab handle and apply the swab tip to the skin.
3. Use firm, back-and-forth strokes over the designated area for 20 to 30 times, rotating the swab as you go to use all sides.
4. While still holding the swab, open the tube with your free hand and insert the swab head into the collection tube without touching the tip to anything else.
5. Bend the swab handle at the designated score line until it snaps off.
6. Securely screw the cap onto the tube.
7. Label the tube with the **date**, your **last name,** and the timepoint (either "**Start**" or "**End**").
8. Store the tube somewhere safe (room temperature) until you mail it back to the Kapha Bio team at the end of the study.
9. When the study is done, we will send you instructions to ship the swabs back using a pre-paid mailing label.

How to: Make the product solution (do this ONCE, Day 0)

1. Identify the two conicals with water and white product powder. Unscrew the lids, and carefully pour the water into the conical with the white powder. Recap the tube firmly.
2. Mix the solution thoroughly: first, mix the conical in an upright position using a gentle swirling motion (30 seconds), and then gently invert the tube to further mix (30 seconds). Mix gently to minimize foaming, and repeat the swirling process if necessary. When fully mixed, the product solution should be clear with a slight yellow tint.
3. Open the spray bottle and place the funnel in the bottle mouth. Pour all of the mixed product solution into the funnel. Once the spray bottle is full, recap the spray bottle. Discard the other two empty conicals.
4. Store in the fridge between uses.

How to: Apply the product (2x a day for 14 days)

1. If you are applying other treatments or products (e.g. moisturizers or creams), apply the product spray onto clean skin before applying other products.
2. Take the spray bottle out of the fridge. Gently rotate the bottle several times to make sure the product is fully mixed.
3. Spray the product solution over the affected area until fully saturated (this will likely be 3-5 pumps).
4. Allow it to dry for at least 60 seconds before touching the area or applying any other products.
5. Cap the bottle and put it back in the fridge.

DETAILED SCHEDULE WITH LINKS

Access the correct combined survey and photo upload link via the calendar below.

Day	Survey Activity		AM Sample Collection	Other	Application
Day 0	Pre-use survey + photo			Mix up product	
Day 1		Product perception survey + photo	Swab collection AM		Apply product AM and PM
Day 2					Apply product AM and PM
Day 3		Product perception survey + photo			Apply product AM and PM
Day 4					Apply product AM and PM
Day 5					Apply product AM and PM
Day 6		Product perception survey + photo			Apply product AM and PM
Day 7					Apply product AM and PM
Day 8					Apply product AM and PM
Day 9		Product perception survey + photo			Apply product AM and PM
Day 10					Apply product AM and PM
Day 11					Apply product AM and PM
Day 12		Product perception survey + photo			Apply product AM and PM
Day 13					Apply product AM and PM
Day 14		Product perception survey + photo			Apply product AM and PM
Day 15 AM	Post-use survey		Swab collection AM
